

TE5 numerical followups: full 96 h trajectories

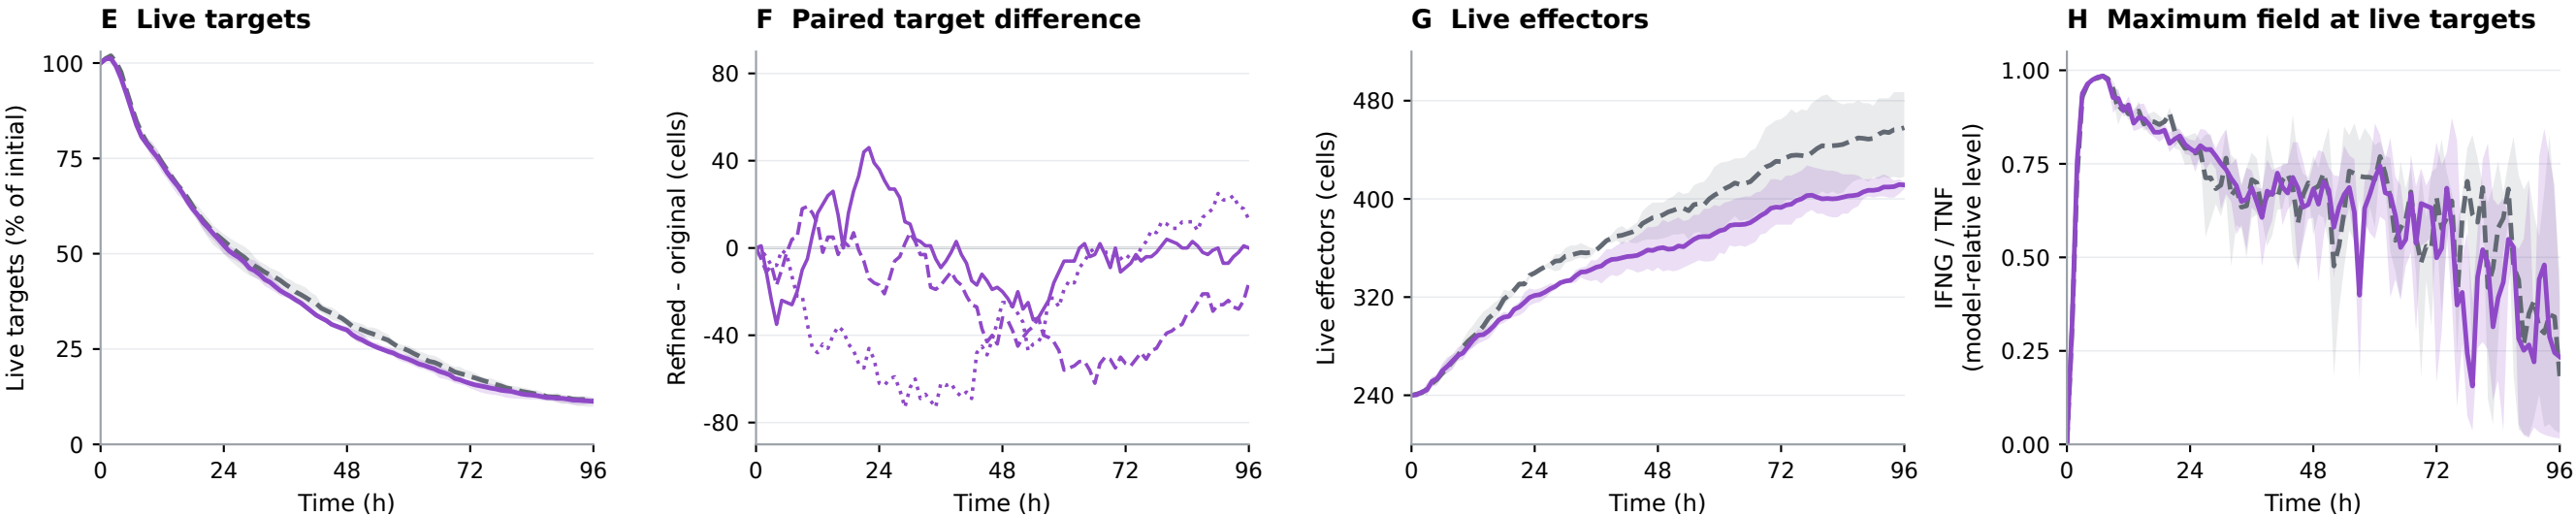

Initial targets:effectors = 5:1 (1,200:240) | Three matched seeds: 0, 1, 2

--- Original setting — Refined setting (row color) — Paired difference: seed 0 - - - - Paired difference: seed 1 Paired difference: seed 2

2D - spatial mesh refinement

Local-entry scenario - all time steps halved

Lines: three-seed means; shaded bands: min-max, not confidence intervals. B and F show same-seed differences.

IFNG and TNF are identical model-relative fields here. The maximum is sampled at currently living targets.

Completed numerical checks; whole-model convergence and biological calibration are not established.
